Acknowledgement of Country

AIDR acknowledges the Traditional Custodians of the various lands on which you all join us from today and the Aboriginal and Torres Strait Islander people participating in this event.

We pay our respects to Elders past, present and emerging and celebrate the diversity of Aboriginal peoples and their ongoing cultures and connections to the lands and waters across Australia.

MARCH 2021

Relationships matter, but how?

It's better to have relationships than none at all....

But it gets complicated.

Interdependence is at the heart of disasters

- “Prototypical” natural disasters affect place-based communities
- Help-givers are often also help-seekers (Varda, et al 2009)
- Disasters are inherently collective events.
 - Shared trauma, losses, social disruption

Interdependence is key to resilience

- A capacity to absorb, adapt, transform
- “The whole is more than the sum of its parts.”
- “People in communities are resilient together, not merely in similar ways.”
(Brown & Kulig, 1996)

- But these are pretty vague contours...
- How do we conceptualise and measure resilience?

Well, it's complicated...

- What type of relationship?
- How many?
- Under what circumstances?
- Good for *what*?
- Good for everyone involved?
- Positive versus negative influences?
- How does a relationship between two people affect a third person?

Slime moulds and the Japanese rail system

Tero, A., Takagi, S., Saigusa, T., Ito, K., Bebbler, D. P., Fricker, M. D., ... & Nakagaki, T. (2010). Rules for biologically inspired adaptive network design. *Science*, 327(5964), 439-442.

Slime moulds and the Japanese rail system

- Simple **local** processes/principles
- But remarkable **system-wide** properties

People have many possible social connections with each other.

- *Roles:* Marriage/Kinship, Friends, Coworkers, Caring
- *Content:* Support, Information, Advice
- *Emotion/behaviour:* Liking/Disliking, Trust, Conflict

Social Network Analysis (SNA)

Relations, ties

Trust

Advice

Knowledge

Disagree with

Social support networks

Social support networks

- Close emotional connections
- Practical assistance
- Role relationships:
 - Spouses, friends, family, neighbours, etc.
- Mental health outcomes:
 - Depression, PTSD

Results: Depression

Sender effect:
Outgoing ties

- Feeling close to others predicts less depression
- Analogous to perceived social support
- Two important qualifications...

Results: Depression

Sender × Relocated
alter

Left
community

- Loss of social support

Results: Depression

“Contagion”

- Co-occurs across social ties
 - Various selection and influence mechanisms possible (Schaefer & Simpkins, 2014)
 - Social influence: Spread of mood

Results: PTSD

Receiver effect:
Incoming ties

- Fewer incoming ties -> greater risk
 - Low enacted social support from others AND/OR
 - Avoidance -> loss of social support (**Kaniasty et al, 2006**)

Results: PTSD

Receiver \times alter's property loss

- In other words, ego's property loss increased the risk for PTSD for alters to whom ego feels close.
- Collective disaster exposure.

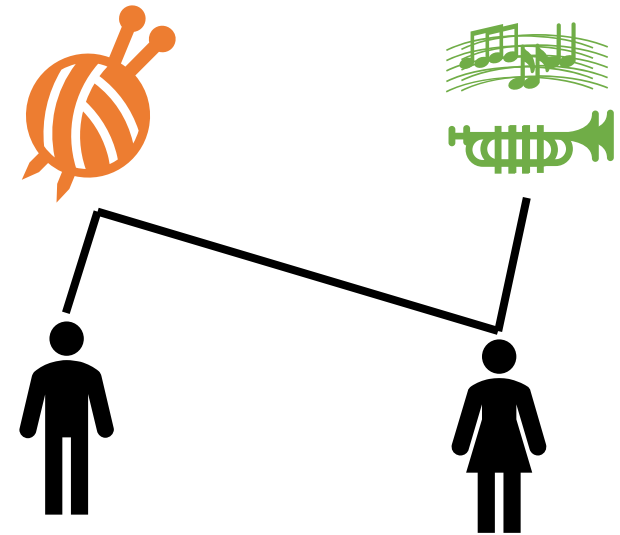

Group involvement & Mental health

Community structure as Group co-affiliation

Community Groups

People

Group involvement

For the individual

- No participation (~45%) – **increased risk of PTSD**

Group involvement

For the individual

- No participation
- One group – decreasing risk of PTSD

Group involvement

For the individual

- No participation
- One group
- 2 groups – most benefit

Group involvement

For the individual

- No participation
- One group
- 2 groups
- 3+ groups – **increasing risk of PTSD**

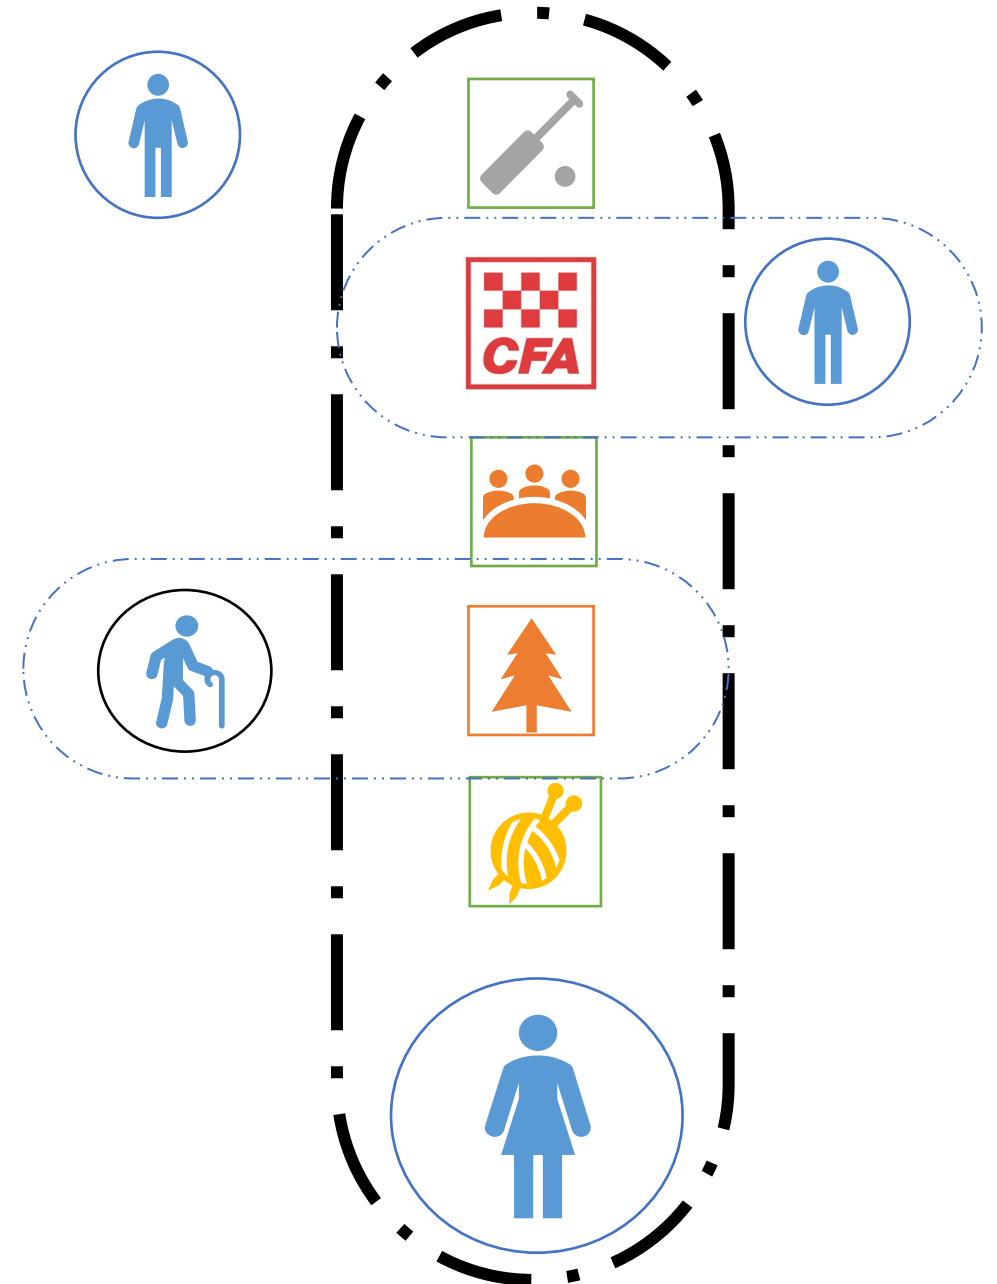

Group involvement

For the community as a whole

Increased risk of PTSD across the community...

- **Imbalanced** group involvement
- A few people overinvolved
- Most people underinvolved
- Centralised, Inequitable

Group involvement

For the community as a whole

Lower risk of PTSD more generally across the community

- **Balanced** group participation.
- Sharing the load.
- Most people involved to some degree.
- De-centralised, equitable
- Even those with no involvements may still benefit.

What to do?

For the underinvolved...

- Foster opportunities for group involvement.
- Behavioural activation.

However...

- Simply creating new groups could have an unintended effect!
- Those who are “good at groups” may simply join more.
- Target the **underinvolved** specifically

What to do?

Measuring group involvement...

- Relatively easy to do.
- Meaningful.
- A potential map for engagement.
 - Popular groups
 - Which groups tend to be people's **only** involvement?
- Distribution is key (Share the load).

Resilient communities

Social support ties...

- Withstand trauma and disruption, and
- Outweigh potential negative social influences
 - mental health, relocation

Group involvement is...

- Balanced, de-centralised, wide-spread moderation
 - Sufficient number and succession of community leaders
- 

Other forms of
connection

- Social, Economic, Infrastructural
- Ecological, Connection to Nature

ABSTRACT

This mixed-methods study explored the role of connection to the natural environment in recovery from the ‘Black Saturday’ bushfires that blazed across Victoria, Australia, in February 2009. Qualitative findings demonstrated that many participants had a strong connection to the natural environment, experienced considerable grief as a result of its devastation in the fires and drew solace from seeing it regenerate over the following months and years. Quantitative analyses indicated that a strong attachment to the environment was associated with reduced psychological distress, fewer symptoms of major depression and fire-related PTSD, and higher levels of resilience, post-traumatic growth and life satisfaction. While social connections are increasingly recognized as supportive of disaster recovery, the influence of landscapes also needs to be recognized in terms of the impact of their destruction as well as their therapeutic potential.

The scale and magnitude of environmental change is escalating

The scale and magnitude of environmental change is escalating

Resilience

Image credit: Getty Images

Many definitions across many scientific fields

Social science perspective (often applied in environmental studies): the capacity of social entities (e.g. people) to tolerate, absorb, cope with, and adjust to change

Keck & Sakdapolrak 2013

Image credit: Rand Corporation

Social-ecological systems/sustainability science: people are a part of the natural world; resilience thus relies on linked dynamics between people and nature

Folke 2016

Social-Ecological Systems

Social-Ecological Systems

ECOLOGICAL SYSTEMS

Social-Ecological Systems

ECOLOGICAL SYSTEMS

SOCIAL SYSTEMS

Social-Ecological Systems

ECOSYSTEM GOODS & SERVICES

ECOLOGICAL SYSTEMS

SOCIAL SYSTEMS

HUMAN IMPACTS/MODIFYING ACTIONS

Resilience from a social-ecological systems perspective

Adaptation

the ability of social–ecological systems to tolerate unknown or unforeseen shocks by absorbing, accommodating, or embracing change

minor to moderate changes to practices or behaviours within existing social-ecological systems (e.g., altering existing livelihood practices, technological fix)

or

Transformation

fundamentally reorganize as a response to challenges that are impossible to address within the current system

fundamental changes that can alter dominant social-ecological relationships and create new systems or futures (e.g., diversifying livelihoods, dramatic policy shifts)

(Walker et al. 2004, Folke et al. 2010, Barnes et al. 2017, Barnes et al. 2020)

Resilience requires adaptive capacity

Adaptive Capacity: *'the conditions that enable people to anticipate and respond to change, to minimize the consequences, to recover, and take advantage of new opportunities'*

Cinner, Barnes et al. 2018 *Nature Climate Change*

- Learning
- Resources
- Social support
- Reduce transaction costs

(Barnet 2001; Adger 2003; Tompkins & Adger 2004; Folke et al. 2005; Smit & Wandel 2006)

Social networks and (collective) adaptive capacity

Group-level (e.g., communities, governance systems)

Theories: social capital, collective action

Arguments:

- *Broad network ideas*: connectivity, diversity/heterogeneity, clustering/fragmentation
- *Bridging* networks facilitate coordination, knowledge sharing across scales, and can bring divergent actors together behind common goals
- *Bonding* networks build trust, enhance learning, facilitate shared (negotiated) agreements, and reduce the transaction costs associated with collective action

Social networks and (individual) adaptive capacity

Individual actor-level

Theories: Social capital, social resource, social influence

Arguments:

- **General connectivity** (ties to friends/family) and **network prominence** (e.g. centrality) provides access to resources & social support
- **Brokerage** (bridging ties/betweenness) provides access to diverse sources of information & resources, facilitating novel adaptation responses
- **Social influence** can reinforce adaptive behavior, causing it to spread from peer-to-peer

→ **power & influence** in determining (group-level) response trajectories

Social-ecological systems as social-ecological networks

ECOSYSTEM GOODS & SERVICES

ECOLOGICAL SYSTEMS

SOCIAL SYSTEMS

HUMAN IMPACTS/MODIFYING ACTIONS

Key interdependencies: Social-ecological network configurations

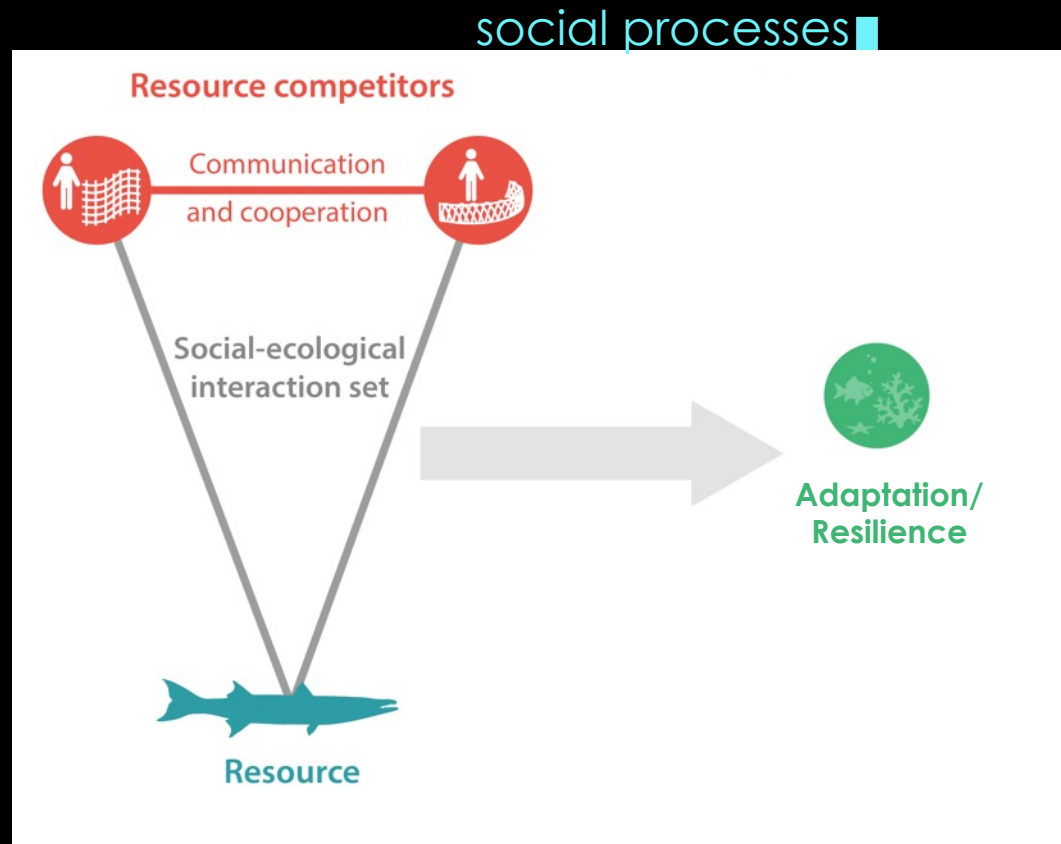

Moreno & Jennings 1938 → social network configurations

Milo et al. 2002 → biophysical network configurations ("motifs")

Bodin & Tengö 2012 → social-ecological network configurations

'Social-ecological network closure'

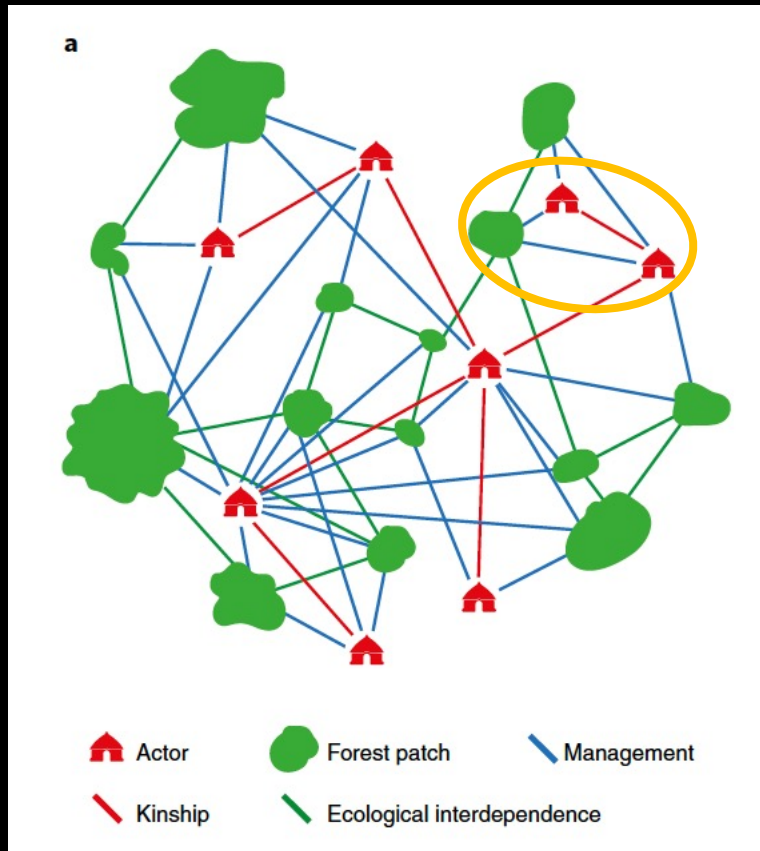

Trust, Learning, Common Norms & Sanctions
Cartwright & Harary 1956, Granovetter 1992, Robins et al. 2011

Sally 1995, Kollock 1998, Balliet 2010

Empirical examples: group level

Forests in Madagascar

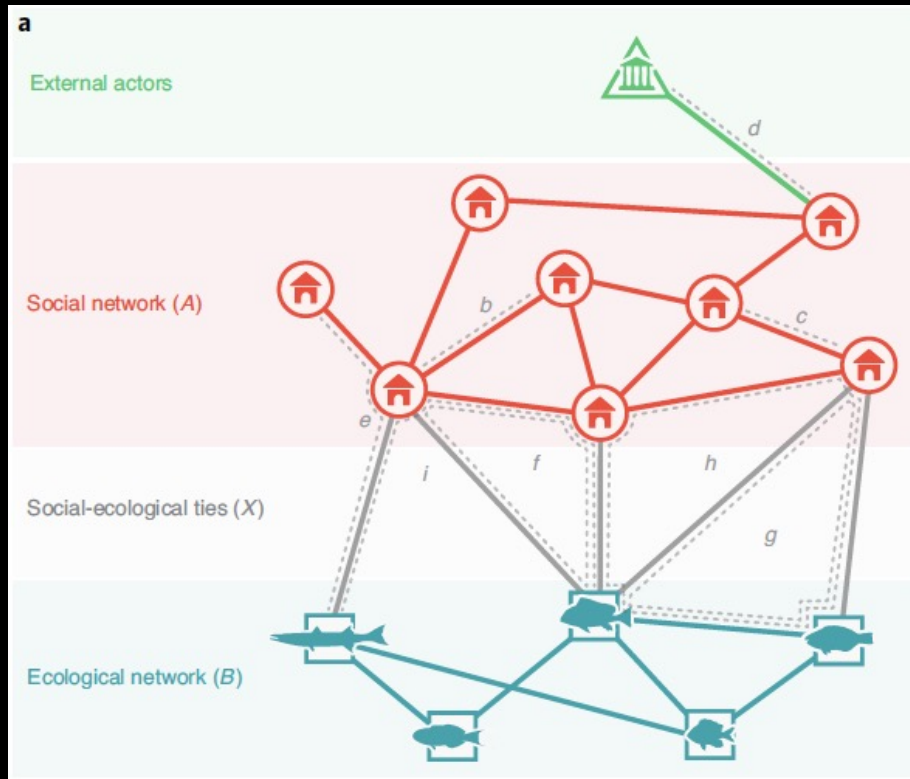

Fisheries in Kenya

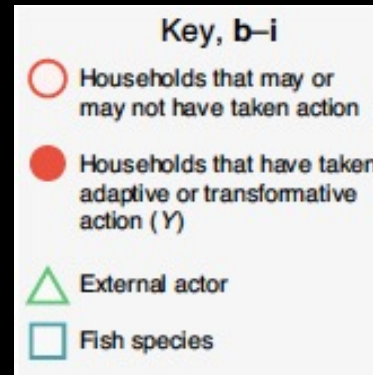

Barnes et al. 2019

Empirical examples: individual level

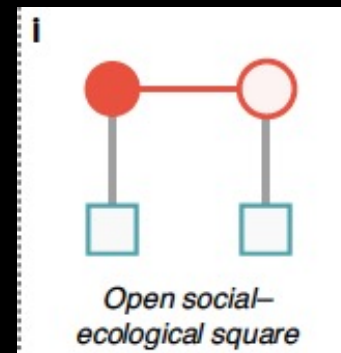

Climate adaptation/transformation in Papua New Guinea

Barnes et al. 2020 *Nature Climate Change*

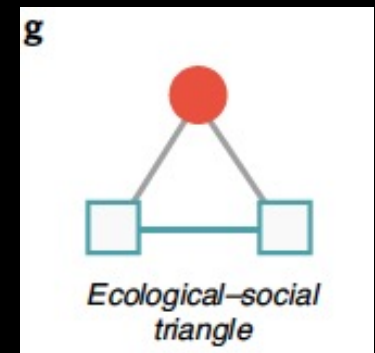

Adaptation

social learning

Transformation

personal experience

Johannes 1989, Reed et al. 2010, Bodin et al. 2014

So what?

Social and social-ecological networks are critical for building adaptive capacity and resilience which enables disaster preparedness, response, recovery, and prevention
